[@MarolleauBenoit](https://twitter.com/MarolleauBenoit)

# Agenda

- Introduction - DevOps & Continuous Innovation
  - New Development Models & Paradigms
  - Cloud Computing, Containers & Technologies Docker, Kubernetes , Microservices
- IBM Cloud Private
  - What is IBM Cloud Private?
  - IaaS : ICP & CAM for Infrastructure Modernization, automation.
  - CI/CD, ICP & Microclimate for App Modernization
- ICP & IBM i: Integration w/ my IBM i Apps
- **Demonstrations**

# Demonstrations

1. IBM Cloud Private : Quick tour  
Private AI (GPU as a Service) & App modernization cloud with Kubernetes Catalog / Helm
2. Automate IBM i VM provisioning with ICP, CAM & PowerVC
3. Microclimate , CI/CD basic demo

Presentations & Video Replay <https://ibm.biz/bma-wiki>

# In a Nutshell...

- **Continuous innovation**, reactivity vs. Business & user needs implies a tool chain for automation (DevOps), new application architecture mixing Cloud Native apps (**Microservices, Containers**) easily updatable and traditional applications.
- **IBM Cloud Private & Kubernetes** hide the complexity of such Cloud Infrastructure and allow to manage containerized apps easily with little effort.
- Even if not always updated that frequently, **Modernizing** existing apps including ILE & Open source based apps on IBM i can be necessary vs. new business needs.
- By creating a Service Catalog on **Cloud Automation Manager** (Terraform based), you can orchestrate Cloud Native Apps running on Kubernetes/ICP or any Cloud (public/private) and Applications deployed on Virtual Machines & LPARs (PowerVC...)
- Automation tooling (CI/CD, Source to Image, SCM...) is necessary for managing frequent application updates: **Microclimate** on top of ICP , as well as other **CI/CD toolchain Solutions** for IBM i (Partner vendors).

# The world is becoming more connected than ever

*Businesses must be ready to face the challenge*

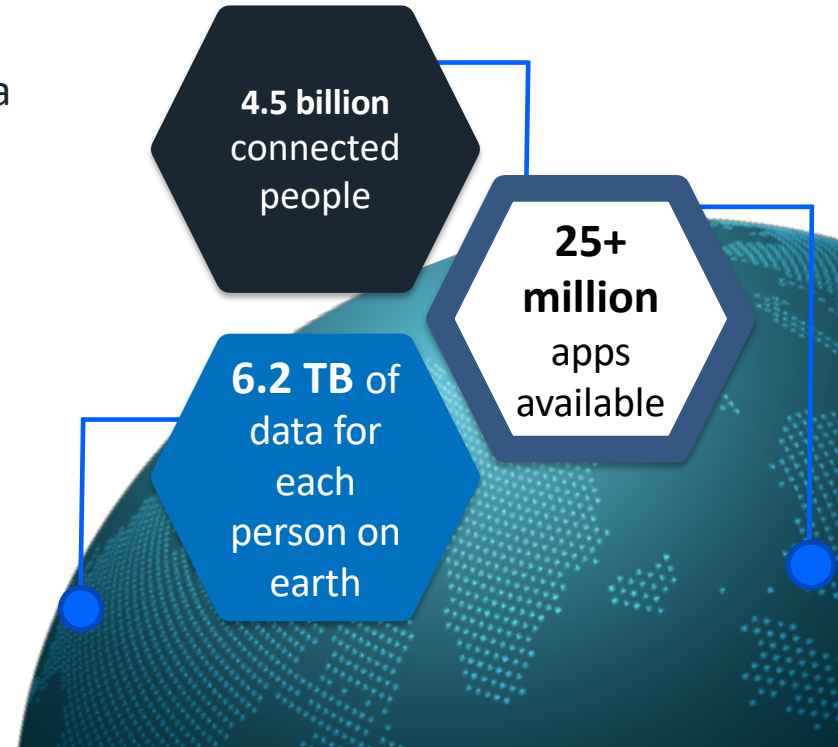

To win in the connected economy, **enterprises are focusing on interactions and value exchange** across a partner ecosystem

## *You need:*

- A better, more compelling customer experience
- An infrastructure that scales out autonomously
- To bring teams together across a partner ecosystem
- Continuous innovation to deliver software faster, consistently, and reliably

Source:<sup>2</sup> RisingStack: How Enterprises Benefit From Microservices Architecture, February 2016

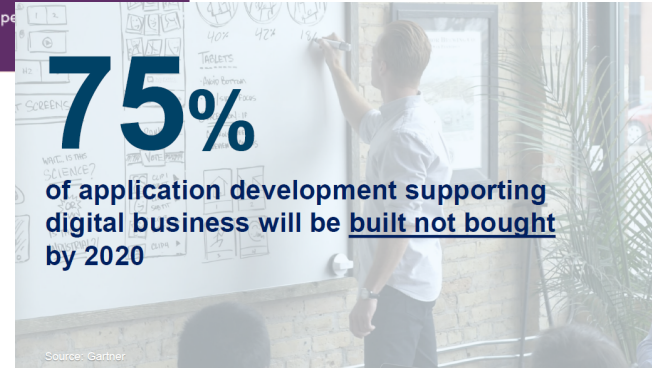

## Location Aware

## On Demand

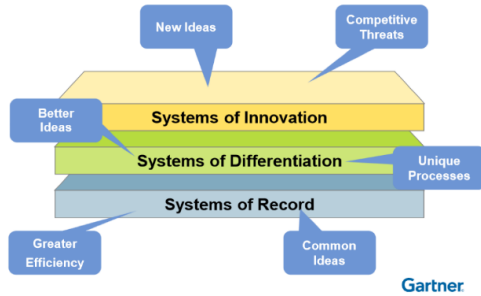

## Personalized and Engaging

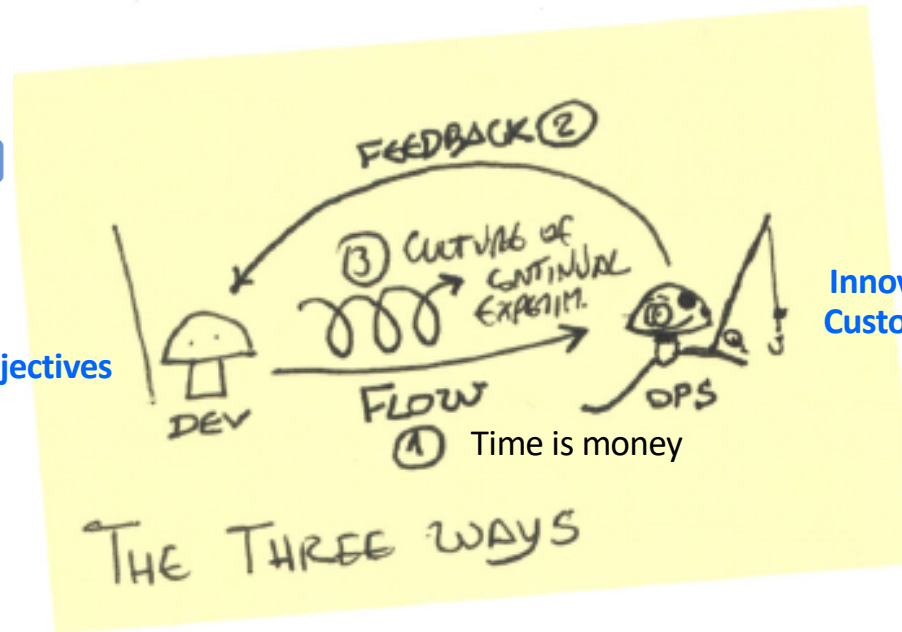

# DevOps & Innovation continue

- DevOps “3 Ways”

Business Objectives & Ideas

1. Accelerate Delivery
2. Feedback Loop
3. Continuous Innovation

Innovation  
Customer Experience

# IT aligned with new business needs

## Development Process

Waterfall

Agile

**DevOps**

## Application Architecture

Monolithic

N-Tier

**Microservices**

## Deployment & Packaging

Physical Servers

Virtual Servers

**Containers**

## Application Infrastructure

Datacenter

Hosted

**Cloud**

A background network diagram consisting of numerous grey circular nodes connected by thin grey lines, forming a complex web of connections across the entire page.

# Containers

# Containers vs. VM

Build

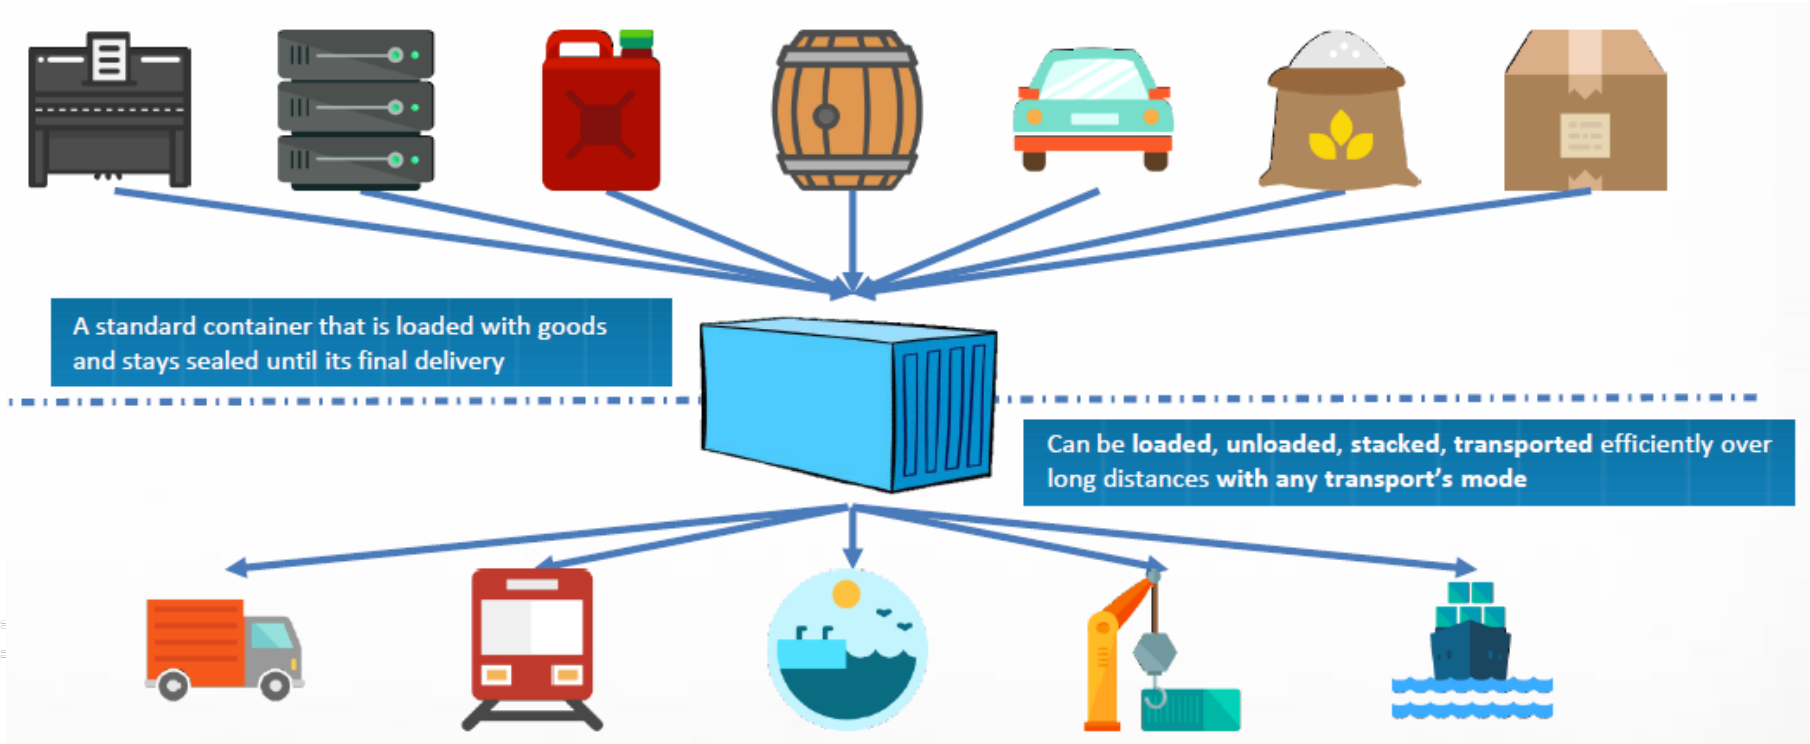

Ship

Run

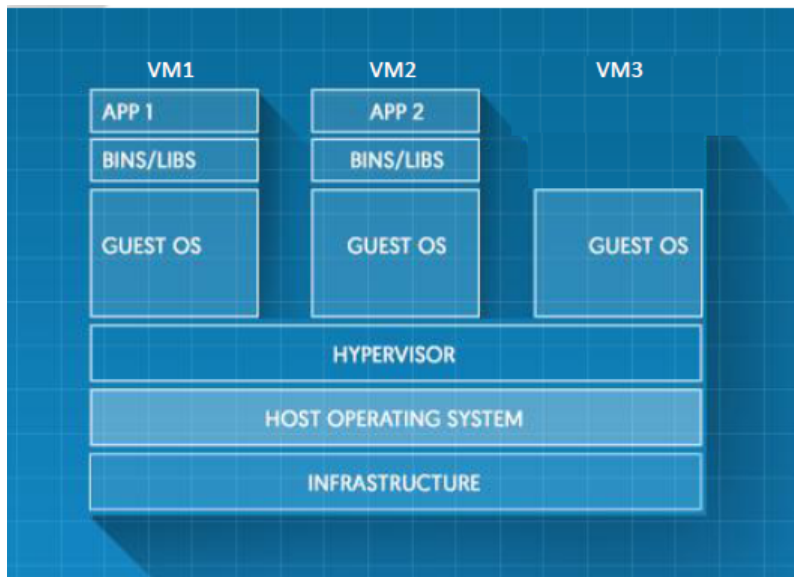

# Docker: Application portability

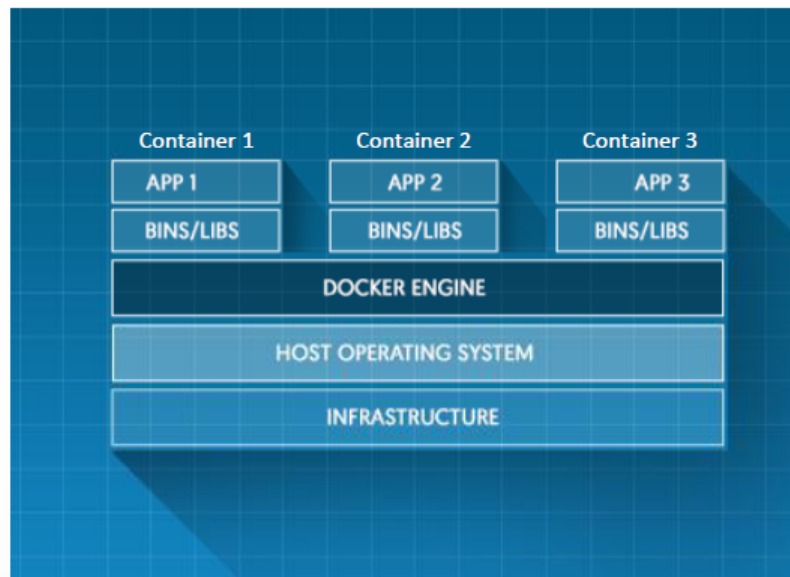

# Containers vs VM

## Virtual Machines

## Containers

### Virtualization Pro:

- Better Security / Isolation
- Allow different Kernel between VMs
- Not Limited to Linux OS

### Containers Pro:

- Better resources utilization
  - Less overhead compare to VM
  - Light compare to VM
  - Very FAST START : No Boot
  - No special hypervisor mode access required
- => could be nested without performance impact.

# Docker : Concepts

- **Engine:** Runs on Linux, it provides the operating environment for Docker containers.
- **Image:** Read-only templates for containers, stored and managed in a registry. Once instantiated a container is created.
- **Dockerfile:** Defines a Docker image as if it was code; used to re-build an image
- **Registry:** A service that allows to store and manage Docker images
- **Container:** Standard unit to package an application and its dependencies: binaries, libraries, system tools... So that it can be moved between environments and run without changes.

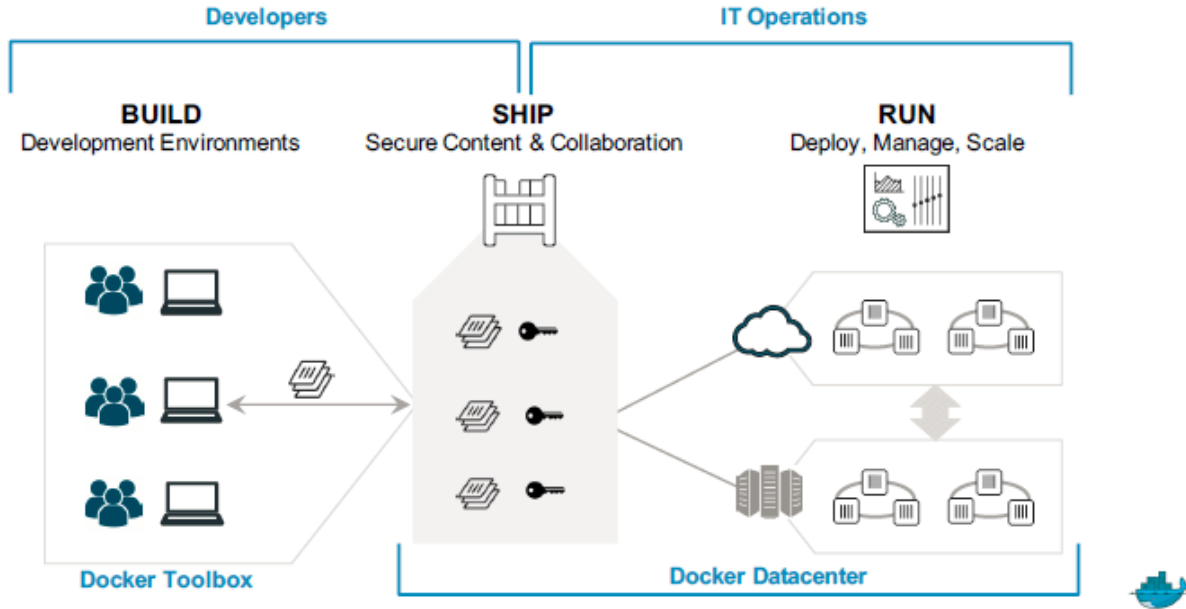

Running on Linux  
platforms...

... built with Golang &  
Open Source!

Started in 2013 (~5 years old)  
But very popular ! => Quick & strong adoption

# Containers & DevOps

**DevOps:** Break down barriers between Dev and Ops teams to improve the app development process

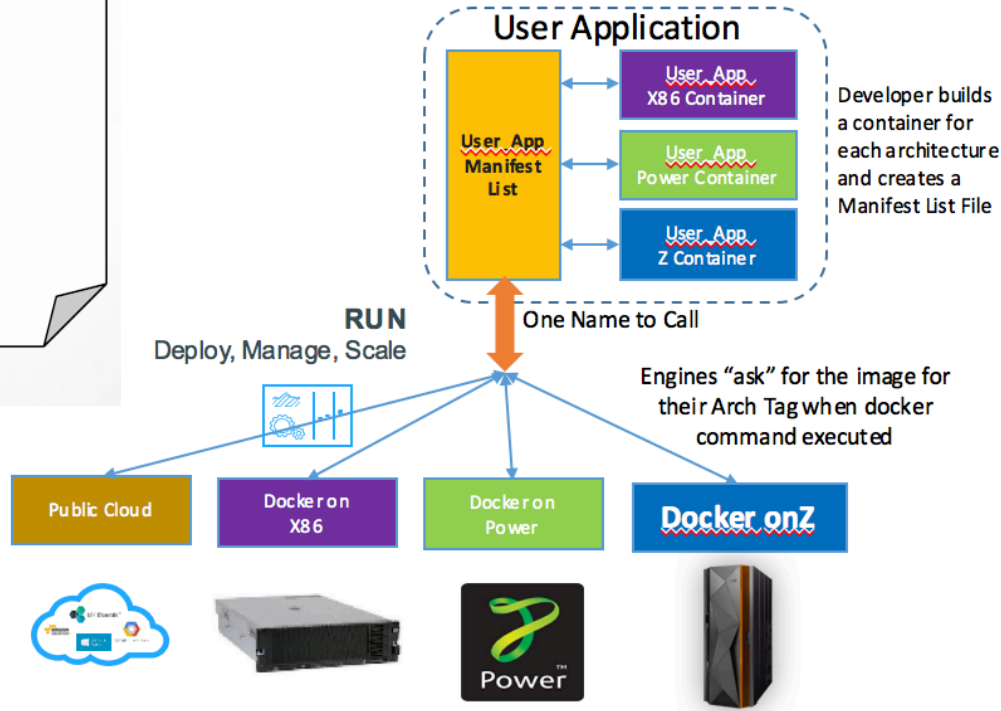

**CI/CD:** Enable developers to develop and test applications more quickly and within any environment

# Multi-Arch & Multi-Cloud Enablement for Docker

```
From ubuntu:14.04  
  
RUN apt-get install <your_app>  
  
ADD <files like conf>  
  
EXPOSE <tcp/udp port>  
  
CMD <start_your_app>
```

Dockerfile example

# Containers are great but ... can lead into lack of control & chaos

---

# Kubernetes – (Κυβερνήτης - Captain in Greek)

---

Regain control with Containers and Kubernetes

- Organize and Govern the Container Chaos

# What do Kubernetes really offer ?

---

## Intelligent Scheduling

Automatically places containers based on their resource requirements and other constraints, while not sacrificing availability. Mix critical and best-effort workloads in order to drive up utilization and save even more resources.

## Self Healing

Restarts containers that fail, replaces and reschedules containers when nodes die, kills containers that don't respond to your user-defined health check, and doesn't advertise them to clients until they are ready to serve.

## Horizontal Scaling

Scale your application up and down with a simple command, with a UI, or automatically based on CPU usage.

## Service Discovery and Load Balancing

No need to modify your application to use an unfamiliar service discovery mechanism. Kubernetes gives containers their own IP addresses and a single DNS name for a set of containers, and can load-balance across them.

## Automated rollout and rollback

Kubernetes progressively rolls out changes to your application, while monitoring application health to ensure it doesn't kill all your instances at the same time. If something goes wrong, Kubernetes will rollback the change for you. Take advantage of a growing ecosystem of deployment solutions.

## Secret and configuration management

Deploy and update secrets and application configuration without rebuilding your image and without exposing secrets in your stack configuration.

# Kubernetes Concepts

- Declarative Configuration (YAML) & Decoupling
  - Services, loosely coupled apps
- Consistency / Scaling
  - Application SLA vs. OS SLA
- Abstraction layer
  - K8s is present in all Cloud Provide
  - Pods, or groups of containers =
  - Kubernetes services =
  - Namespaces =

A group of co-located containers

## Replica Set

A replication controller ensures that a specified number of pod replicas are running at any one time.

## Volumes

A volume is a directory, possibly with some data in it, which is accessible to a Container as part of its filesystem.

## Stateful Set

A StatefulSet is a Controller that provides a unique identity to its Pods. It provides guarantees about the ordering of deployment and scaling.

## Service

A service defines a set of pods and a means by which to access them, such as single stable IP address and corresponding DNS name.

## Labels

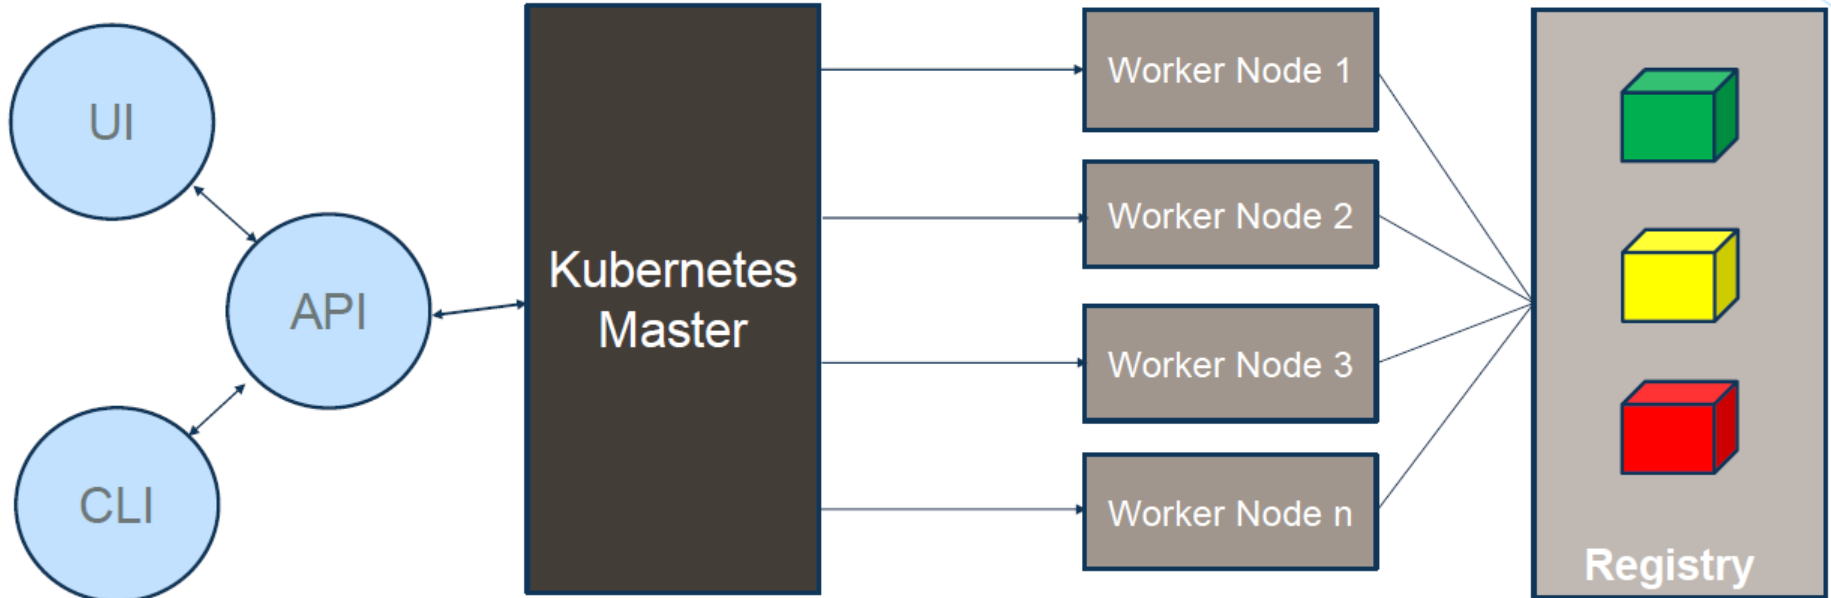

A label is a key/value pair that is attached to a resource, such as a pod, to convey a user-defined identifying attribute.

## Efficiency

- Machine usage optimization – distribution of application

# Kubernetes Architecture

- Etcd
- API Server
- Controller Manager Server
- Scheduler Server

# And HELM is ...

---

## The package manager for Kubernetes

Helm is the best way to find, share, and use software built for [Kubernetes](#).

Tells Kubernetes all it needs to know about an application its parameters and dependencies

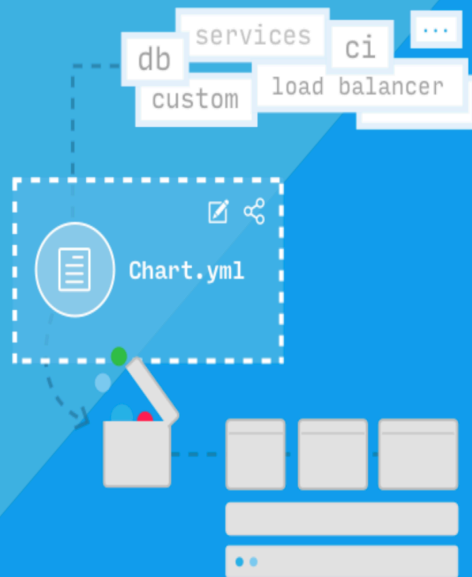

## What is Helm?

Helm helps you manage Kubernetes applications — Helm Charts helps you define, install, and upgrade even the most complex Kubernetes application.

Charts are easy to create, version, share, and publish — so start using Helm and stop the copy-and-paste madness.

The latest version of Helm is maintained by the **CNCF** - in collaboration with **Microsoft**, **Google**, **Bitnami** and the **Helm contributor community**.

# Microservices

# Microservices & Cloud Native Apps

## Monolithic Architecture

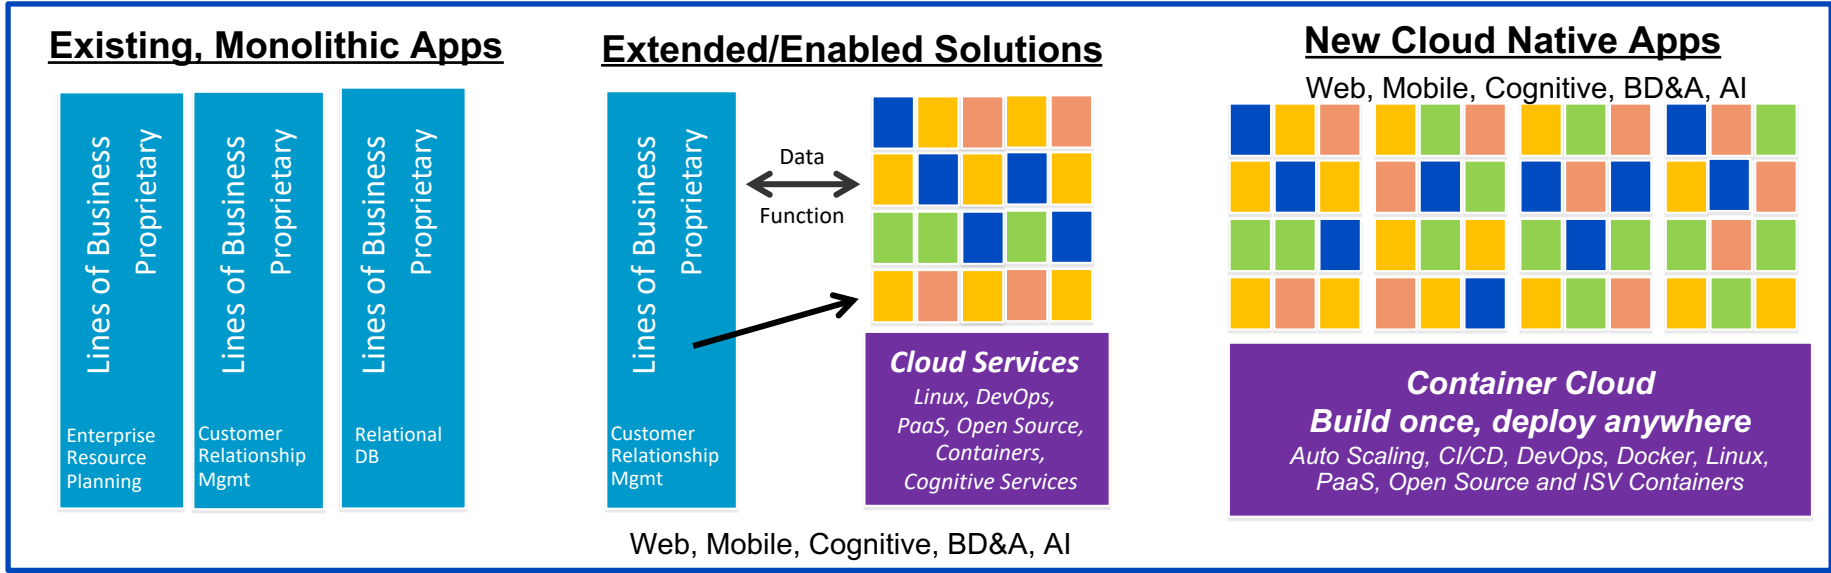

## Microservices Architecture

# Cloud is changing how workloads are built and delivered

## Goldman Sachs Shifts to Docker

... a yearlong project that will shift about 90% of the company's computing to containers, according to Mr. Duet. That includes all of the applications, nearly 5,000 in total, that run on its internal cloud.

**THE WALL STREET JOURNAL.**

2/24/16

By 2018, over **60%** of New Apps will Use **Cloud-Enabled**  
Continuous Delivery and **Cloud-Native Application**

Architectures to Enable Faster Innovation and Business Agility. *IDC Predicts*

# Why microservices?

# The microservices revolution

***Connecting people and digital apps better than ever before***

A **microservices architecture** is gaining traction for developing and delivering cloud-native workloads across public, private, and hybrid application environments

60%

***60% of new apps will use cloud-enabled continuous delivery and cloud-native application architectures to enable faster innovation and business agility\*\****

IDC FutureScape: Worldwide Cloud 2016 Predictions  
– Master the Raw Material of Digital Transformation,  
November 2015

## ***Why?***

- ✓ Decomposed into small pieces
- ✓ Loosely coupled
- ✓ Easier to scale development
- ✓ Improved fault isolation
- ✓ Each service can be developed and deployed independently
- ✓ Eliminates any long-term commitment to a technology stack

## I. Codebase

One codebase tracked in revision control, many deploys

## II. Dependencies

Explicitly declare and isolate dependencies

## III. Config

Store config in the environment

## IV. Backing services

Treat backing services as attached resources

## V. Build, release, run

Strictly separate build and run stages

## VI. Processes

Execute the app as one or more stateless processes

## VII. Port binding

Export services via port binding

## VIII. Concurrency

Scale out via the process model

## IX. Disposability

Maximize robustness with fast startup and graceful shutdown

## X. Dev/prod parity

Keep development, staging, and production as similar as possible

## XI. Logs

Treat logs as event streams

## XII. Admin processes

Run admin/management tasks as one-off processes

The background of the slide features a complex network diagram. It consists of numerous small, light-gray circular nodes scattered across the frame. These nodes are interconnected by a dense web of thin, light-gray lines, creating a mesh-like structure that resembles a neural network or a data network. The overall aesthetic is clean and technical.

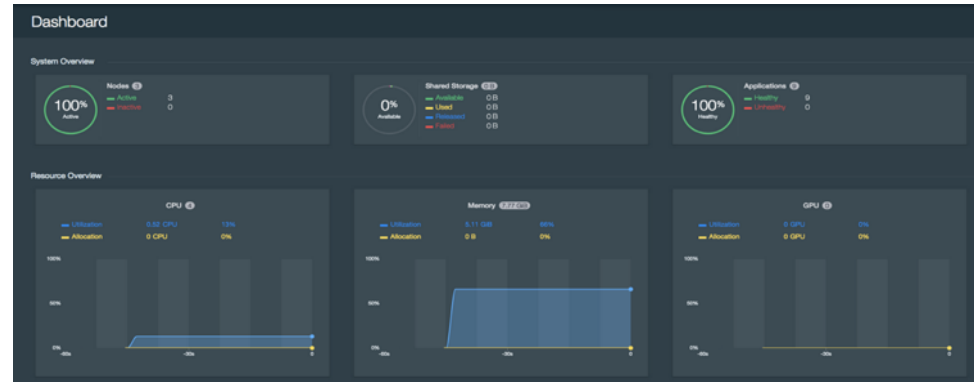

# IBM Cloud Private

# IBM Cloud Private

- A private cloud platform for enterprises to develop and run their workloads locally
- An integrated platform consisting of PaaS and developer services necessary to create, run, and manage cloud applications
- Container infrastructure, orchestration and management
  - ✓ Resource management
  - ✓ Application life-cycle management/schedule/deployment
  - ✓ Scaling, rolling upgrade
  - ✓ Service registry/discovery
  - ✓ Distributed storage management
  - ✓ Image/software repository management
  - ✓ Configuration management
  - ✓ User/Account management

kubernetes

**Kubernetes based container platform**

Industry leading container orchestration platform

**Common Services**

Simplify operations management, DevOps, and hybrid integration

**IBM Middleware, Data and Analytics services**

Optimize current investments and rapidly innovate

# Built with open standards

## *preventing vendor lock-in*

Executable package of software that includes everything needed to run it

**Containers**

Automate deployment, scaling, and management of containerized applications

**Orchestration**

Define, install, and upgrade Kubernetes applications

**Management**

Infrastructure as code to provision public cloud and on-premises environments

**Provisioning**

# IBM Cloud Private Solution Overview

**Enterprise Content Catalog of IBM Middleware, Open Source:** e.g. Data, Analytics, Developer Services

Cloud-enabled middleware, application runtimes, messaging, databases & analytics to optimize current investments and rapidly innovate

**Core Operational Services**

To simplify Operations Management, Security, DevOps, and hybrid integration

Terraform

IBM Cloud  
Automation Manager

**Cloud Automation Manager**

Infrastructure as Code for multi-cloud provisioning to public and on-premises private clouds

kubernetes

**Kubernetes-based Container Platform**

Industry leading container orchestration platform

**App Catalog**

Easily launch applications

**Runs on existing IaaS:** vmware

NUTANIX  
Your Enterprise Cloud Platform

System Z

IBM  
Spectrum

Dell, Cisco, NetApp,  
Lenovo, ...

# IBM Cloud Private – Specific Use Cases

## Use Case #1

**Modernize and optimize existing applications**

- Time to market acceleration
- Legacy or monolithic apps
- Existing WAS, MQ, DB2 infrastructure / migration
- DevOps initiatives and enterprise developers
- x86, Power and zLinux

## Use Case #2

**Opening up enterprise data centers to work with cloud services**

- Securely open your datacenter
- GDPR
- API Economy
- Integrate public cloud services securely with your local cloud
- new web/mobile presence
- customer loyalty
- B2B initiatives

## Use Case #3

**Create new cloud-native applications**

- New use cases
- IoT
- Blockchain
- Machine Learning
- Data science experience
- Building MicroServices

**IBM Cloud Private**

# IBM Cloud Private Editions

## Community

### Platform

- Kubernetes (+ Helm)
- Core services
- Content catalog (Containers)

**Freely Available  
in Docker Hub**

## Cloud Native

### Platform

- Kubernetes (+ Helm)
- Core services
- Content catalog (Containers)

### Cloud Foundry (Optional)

### IBM Enterprise Software

- Microservice Builder
- WebSphere Liberty
- IBM SDK for node.js
- Cloud Automation Manager

## Enterprise

### Platform

- Kubernetes (+Helm)
- Core services
- Content catalog (Containers)

### Cloud Foundry (Optional)

### IBM Enterprise Software

- Cloud Native Edition, plus:
- + WAS ND
  - + MQ Advanced
  - + API Connect Professional

# IBM Cloud Private – Packaging and Purchasing Options

New!

Community

Power Systems Entry  
for ICP bundle\*

Cloud Native

Enterprise

ICP Software  
Bundle “Paks”

## Common Core Platform Services

- Kubernetes (+ Helm)
- Core services
- Discover and Try Content catalog (Containers)

### Freely available in Docker Hub

- Entitles clients to Dev/ Test only, not for use in production
- High Available (HA) not available
- Best effort support by ICP and community teams
- Same code base as Cloud Native edition

### Client Supplied and Trial Version Software

- Entitles clients to Dev/Test, Production and HA
- Low entry cost; 12-month term
- Support included
- Available when ordered with Power servers
- Special upgrade price to Cloud Native at end of term
- Available in AAS

### IBM Enterprise Software

- Nominal upgrade from Entry
- Ability to convert to perpetual license
- Includes Cloud Automation Manager and other IBM Software
- Available in PPA

### IBM Enterprise Software

- Cloud Native Edition, plus:
- WAS ND
  - MQ Advanced
  - API Connect Professional
- Available in PPA

IBM software packages delivered as containers with Cloud Private as their “delivery and management” platform

\* Available only when included with IBM Power Systems servers

## Low Cost Private Cloud Entry Point for Power Clients

- “Starter” environment for modern multi-Cloud platform available with Power Systems servers
- Fully supported by IBM (7x24) including HA
- Easily add new ICP software editions / Paks
- Low cost upgrade to Cloud Native Edition

## IBM Power Systems Entry for Cloud Private

New!

- A small-scale Power server hardware + software platform for clients to test and learn about IBM Cloud Private, Kubernetes and micro-services
- Available when ordered with an IBM Power Systems server
- Supported on all classes of Power servers
  - Power Systems Enterprise servers
  - IBM Hyperconverged powered by Nutanix
  - Power Systems scale out servers
- Includes all core platform services
- Entitles client to Cloud Private platform services for 32 worker node cores, 1 management node and 3 HA masters
- Provides 7x24 IBM support including production and HA environments
- Discounted upgrade to Cloud Native available at end of 12 months available

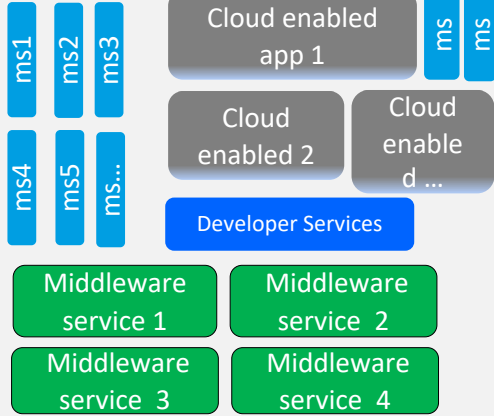

# The Architect's view : ICP + Cloud Automation Manager

## Hybrid Management

- Application Management/Monitoring
- Event Management
- Runbooks, Notification, DevOps Integration

## Hybrid Orchestration Cloud Automation Manager

Developer Services

Middleware service 1  
Middleware service 2  
Middleware service 3  
Middleware service 4

VM Based Workloads - 1

VM Based Workloads - 2

VM Based Workloads - 3

## IBM Cloud Private

Logging, Monitoring, Security ...

Virtualization/IaaS Layer

## Cloud Native application logic (Innovating)

- Microservices

## Middleware Services (some IBM and some from the open source world)

- Each instance supports 1..n microservices
- IIB, DB2, Open Databases like Redis, Mongo, Messaging, API C, Datapower

## Cloud Enabled (Modernizing)

- Monolithic applications made to run in containers
- Brought from WAS ND or WAS Base to Liberty

## Add new function, expose APIs

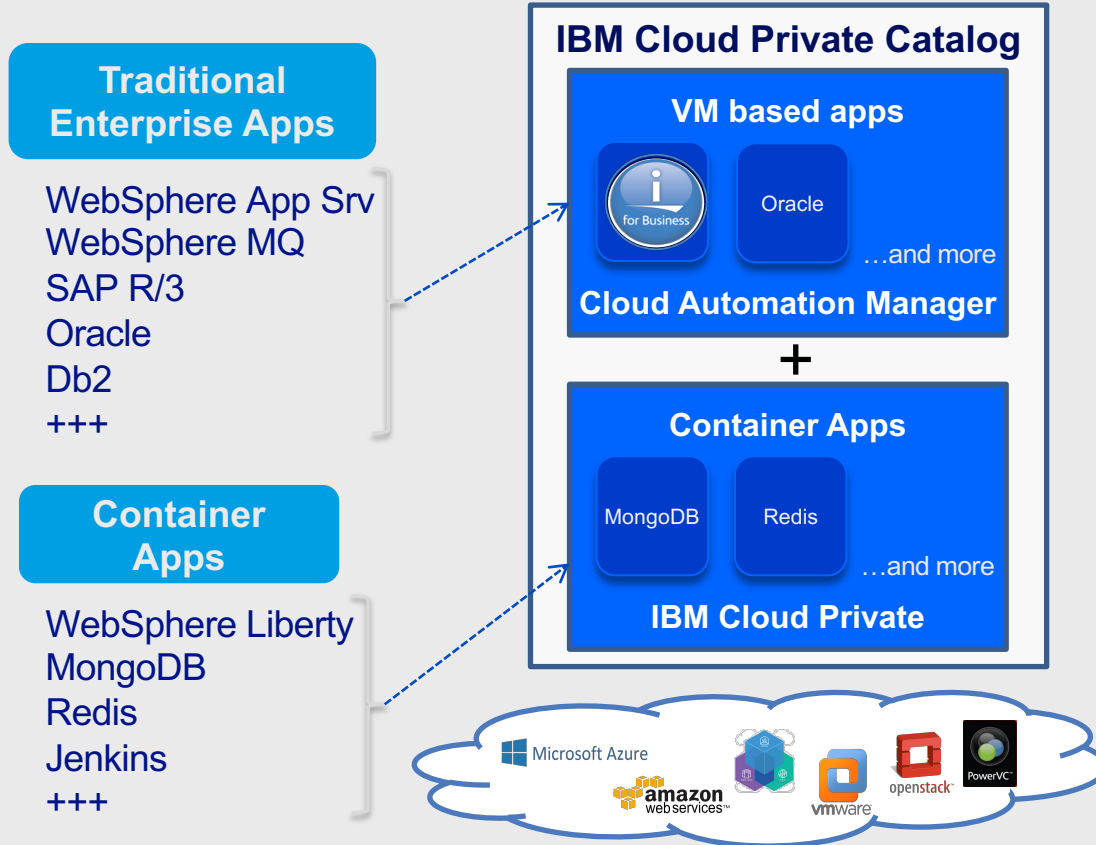

## VM Based Workloads

- WAS Base, WAS ND, BPM and others as necessary, CAM provisioned

All holistically plugged into existing Enterprise Facilities for Management, Monitoring and Security

# Cloud Enable your Mission Critical Applications *including existing applications running on AIX and IBM i*

- Deploy existing **VM-based applications** in a multi-cloud environment with **Cloud Automation Manager (CAM)**
- Add any **AIX, IBM i, or Linux VM-based** application to the Cloud Private catalog
- Integrate new services with existing mission critical workloads (e.g. DBs), achieving a **single catalog** and **coordinated orchestration**
- Deploy and manage applications with a **common self-service interface**, seamlessly align workloads to most optimized infrastructure
- Manage **integrated clusters** of Power, z/LinuxONE, and Intel servers

Architectures

# IBM Microclimate

microclimate-dev2ops.github.io

An integrated development environment for building cloud native applications

Rapid onboarding  
and app creation

Run Locally or via Catalog on  
ICP

Web-based IDE  
supporting full  
lifecycle, or BYOE

Included web IDE, or bring  
your own

Powered by

Language Server Protocol (LSP)

Rapid dev cycle  
(Inner Loop)

Instant monitoring  
& feedback

DevOps Pipeline

Get into production  
fast with a  
preconfigured DevOps  
pipeline

# Microclimate: Key use cases

**1**

Simplify the creation  
and deployment of  
microservices

**2**

Modernize and  
optimize existing  
applications

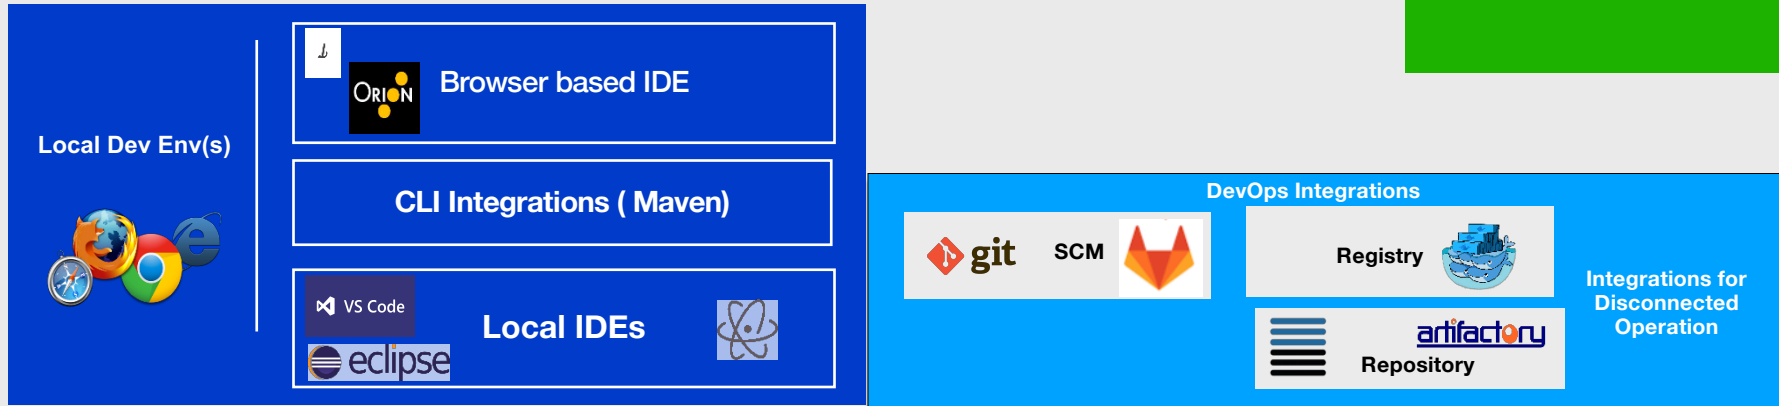

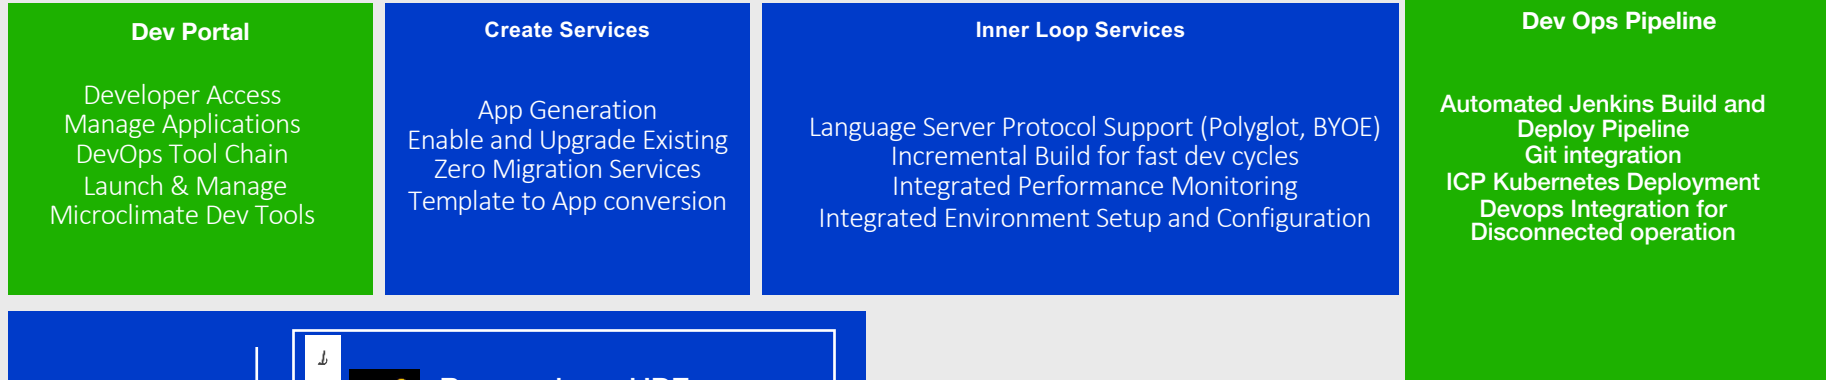

**3**

Embrace new  
programming practices  
such as agile and  
devOps

Microclimate provides a full cycle developer experience

# Microclimate scope

Legend:

A background network diagram consisting of numerous grey circular nodes connected by thin grey lines, forming a complex web of connections across the entire page.

# IBM Cloud Private & IBM i

# IBM i Apps & Cloud Native Apps

- ❑ ICP = based on Open Standards , for creating & deploying quickly new apps & new micro-services
- ❑ Need to complement this solution with a “DevOps” approach (automation, test..)
  - ❑ CI/CD : Microclimate, DevOps solutions for IBM i, ...
- ❑ On the IBM i side , a few Challenges :
  1. Existing Apps understanding
  2. Modernize my Apps, good practices for the existing & new ones
    - Rewriting vs. Refactoring
    - Data Centric Approach – Use Db2 for i & OS features,...
    - Modular Design vs. Architectural Monolith
    - **DevOps** Approach– Toolchain CI/CD (mandatory?) integrating your **IBM i environment**.
  3. IBM i Integration with Cloud Native Apps
    - Open Source Tools & frameworks on IBM i.
    - Expose your apps & data on IBM i via standards - Web Services & API / Microservices on IBM i

Factors	Refactor	Re-write
Risk of losing the market	+	-
Accumulated knowledge	+	-
State-of-the-art technology	-	+

Factors to consider while deciding between refactor and re-write

# IBM i Apps & Cloud Native Apps

- ❑ Why a modular approach / micro services on IBM i ?
  - ❑ Collaborative devs & application integration made easier
  - ❑ Time saver for innovative projects & frequent apps changes & enhancements
  - ❑ Relevant for pure IBM i devs (RPG ILE, Java, Node.js, PHP) or hybrid (IBM i + Cloud ).
- ❑ Part of a global **DevOps** methodology & mindset , **for any Cloud Apps (SoE) & IBM i Apps**
  - requires a DevOps mindset...and appropriate tooling : **Toolchain, Delivery Pipeline**
  - IBM Solutions , Open Source & Third Party

# IBM i Apps & Cloud Native Apps

# Demo 2: IBM i VM Provisioning

ICP/CAM : Infrastructure Modernization & Private Cloud (K8s/VM)

Scenario: I need a new VM for dev/test

Private Git / Helm Repo / Private Registry  
 Git push/pull CAM Templates/Services  
 Git push Helm Charts  
 Docker push images  
 Docker images

## Demo 3 : Basic CI / CD Demo with Microclimate

1) Microclimate (free) can be installed on a desktop or on top of ICP:

→ Demo with Microclimate on ICP

2) Includes Git & Jenkins for Automating tasks: build, deploy...

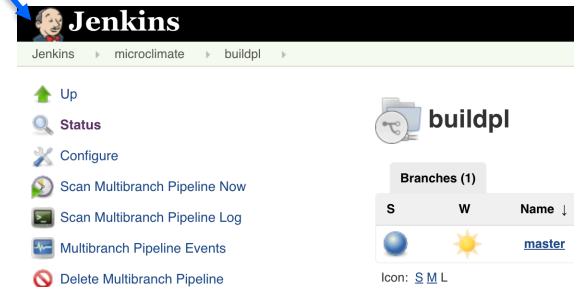

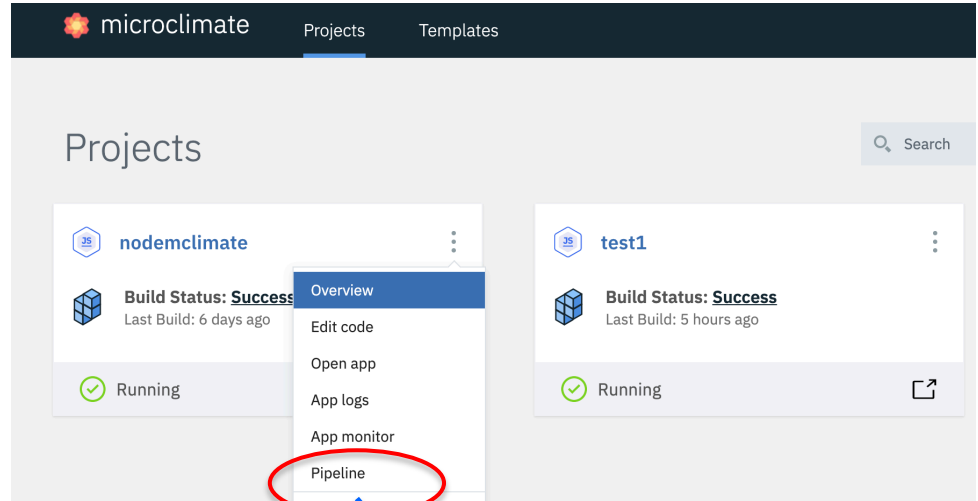

→ Source (git) to Image (container Image) build automation

→ Deployment in the K8s / ICP cluster

3) Access to the deployed application

A next version of this demo would include artifacts & code for IBM i (ILE / PASE) using the same toolchain or integrated with an existing IBM i DevOps toolchain.

[External Slack Channel](#)

Microclimate is an end to end development environment that lets you rapidly create, edit, and deploy applications. Applications are run in **containers** from day one and can be delivered into production on **Kubernetes** through an automated DevOps pipeline using **Jenkins**. Microclimate can be installed locally or on **IBM Cloud Private**.

How sharp are your coding skills? Do you consider yourself a master strategist? Are you willing to bet your character's life on it? Welcome to Rogue Cloud, our homage to the old school **roguelike** games. We spared you the monochrome graphics, but kept to tradition by creating an open-world, turn based world crawler complete with a top-down 2D multiplayer experience. However unlike a traditional game, where you get the luxury of a controller, keyboard, or mouse, with Rogue Cloud, you are writing code to ensure your character's success...and survival, in a dangerous world.
